

Community First: Building the Foundation for Sustainable Economic Development

A White Paper from a Practitioner's Perspective

By Wende Ragonis Anderson

January 27, 2026

Executive Summary

Economic development strategies too often begin with business recruitment and workforce initiatives, assuming that community alignment and quality of life will naturally follow. In reality, the opposite is true. Sustainable, resilient growth starts with community first. ***Its people, values, culture, institutions, infrastructure, and shared identity.*** Only after that foundation is established can workforce systems, business ecosystems, and economic opportunity scale in a way that is durable, inclusive, and fiscally responsible.

This white paper advances a simple but powerful premise: build community first, then support workforce, business, and quality of life, because those systems are downstream of community health, not separate from it.

It argues for:

- Aligning economic development with industries a community can realistically support using its *existing workforce and assets*, rather than chasing aspirational sectors that require heavy, speculative investment.
- Designing development strategies that are incremental, resilient, and locally reinforcing, rather than fragile, extractive, or subsidy dependent.
- Treating municipal investment in the community itself as the highest-return economic development strategy available.

The return on investment (ROI) for this approach is not abstract—it is measurable in higher business retention, stronger labor participation, lower infrastructure liabilities, fiscal sustainability, improved social cohesion, and long-term competitiveness. **The Core Principle:**

Community Is the Economic Engine

- Communities do not grow because businesses arrive. Businesses grow because communities are strong.
- Workforce pipelines do not function because training programs exist. They function because people choose to live, stay, and invest their lives in a place.

Economic ecosystems are not built through isolated projects; they emerge from trust, density of relationships, shared purpose, and local capacity. Community is the foundational layer and everything else is built on top of it.

When municipalities prioritize neighborhood stability, civic pride, social infrastructure, strong local institutions, high-quality public spaces, mobility, housing diversity, and cultural identity, they are not investing in “soft” development, they are building the hard infrastructure of economic resilience. These foundational elements shape talent attraction and retention, support business growth, and create places where people choose to live, work, and invest over the long term.

Aligning to What You Can Actually Support

One of the most common failures in economic development is misalignment. Too often, communities pursue industries they admire rather than industries they can realistically support and sustain. When industry attraction is disconnected from workforce capacity, the result is predictable: persistent workforce shortages, talent leakage, overreliance on external recruitment, and fragile business ecosystems.

A healthy, resilient economic development strategy begins by aligning growth with the community’s existing ecosystem. That requires asking different questions:

- What skills already exist within our workforce?
- Which industries naturally align with those skills?
- What adjacent or complementary sectors can evolve from them?
- Which supply chains can be supported locally or regionally?
- What training pathways require minimal investment to unlock new opportunities?

This approach reduces capital intensity, lowers public-sector risk, and accelerates scalability. When a community builds on its existing talent base, local ownership of the strategy is strengthened, and retention of both new and startup industries improves.

Rather than reshaping the community to fit an industry, this strategy reshapes industry alignment to fit the community, creating a business ecosystem that is durable, competitive, and sustainable over the long term.

Workforce is an Asset, Not a Gap

A community’s workforce pipeline should be viewed as a strategic asset that strengthens resilience by upskilling local talent and creating stackable pathways for career progression.

Technician-level and middle-skill roles must be intentionally valued as critical drivers of economic competitiveness.

Workforce development should be treated as community development. When workforce systems are aligned with existing community capacity, investment needs are lower, outcomes are achieved more quickly, and adoption by employers and workers is significantly higher.

Business Follows Belonging

Entrepreneurs and employers do not choose locations based solely on incentives or infrastructure; in many high-demand markets, businesses increasingly forgo incentives altogether because the value of being there outweighs any monetary contribution from the municipality. Instead, they choose places where talent wants to live, families feel safe, employees can thrive, networks are strong, relationships are accessible, communities are welcoming, and local identity is authentic. In this way, the community itself becomes the incentive offering strong culture, trusted networks, and civic alignment. These are values that no incentive package can replicate.

Municipal ROI: Investing in the Community Itself

Municipalities often measure return on investment by focusing on jobs created, capital investment, and tax base growth, yet the highest-yield returns are frequently generated upstream through community-based investments. Strategic investments in neighborhood reinvestment, local business corridors, high-quality public realms, walkability and connectivity, small-scale infill, local entrepreneurship support, civic spaces, cultural programming, housing diversity, and local ownership structures increase land productivity per acre, improve tax efficiency, and reduce long-term infrastructure liabilities. Rather than relying on large, one-time projects with uncertain returns, these smaller scale strategic investments build resilience through continuous, compounding value of stabilizing neighborhoods, strengthening local businesses, increasing labor participation, and attracting private capital organically. The return on these investments is cumulative and durable, not transactional.

Within this framework, strategically recruiting large-scale job providers remains an important component of economic development, but only when those employers align with the community's existing workforce, infrastructure capacity, and long-term fiscal health. Rather than chasing volume alone, this approach prioritizes employers whose skill requirements match local talent, whose operations strengthen existing supply chains, and whose growth can be supported incrementally without creating outsized public liabilities. When major employers are recruited into a community that is already financially productive, workforce-aligned, and place-strong, they integrate more quickly, experience higher retention, and contribute durable value to the local economy. In this way, large job providers become accelerators of an already resilient ecosystem not dependencies that require constant public subsidy to sustain.

Incremental Growth, Not Fragile Growth

Resilient communities grow through small bets, local ownership, distributed risk, diverse economic activity, redevelopment, incremental density, and mixed-use environments, not through single-anchor dependency, mega-project concentration, overbuilt infrastructure, subsidy-driven recruitment, speculative development, or dominance by external capital. Incremental growth strengthens the economic fabric of a place by creating built-in shock absorbers, allowing communities to adapt to market shifts, retain value locally, and sustain long-term prosperity without exposing public resources to outsized risk.

Quality of Life Is Economic Infrastructure

Quality of life is not a lifestyle issue, it is a labor market issue, and it is central to workforce retention. Communities that offer strong schools, accessible healthcare, safe and connected neighborhoods, diverse housing options, reliable mobility, vibrant culture, and a genuine sense of belonging are far more likely to retain talent once it arrives. These conditions reduce employee turnover, stabilize the labor force, and increase long-term attachment to place, which in turn lowers recruitment costs for employers and strengthens business competitiveness. By investing in quality of life, communities are not only attracting workers, but they are also keeping them, sustaining participation in the labor market, and reinforcing the foundation of a resilient local economy.

The Community-First Development Model Sequence

matters.

1. Build community capacity
2. Strengthen civic infrastructure
3. Align workforce to real assets
4. Support local business formation
5. Scale aligned industries
6. Reinforce quality of life
7. Reinvest municipal returns back into community

This creates a **self-reinforcing cycle** rather than a dependency loop.

Conclusion: The Strategic Shift

The future of economic development is not recruitment first. It is **community-first**. Not as a slogan. Not as branding. Not as marketing. But as a structural strategy. Communities that invest

in themselves, intentionally, incrementally, and strategically, build the conditions where ***workforce systems thrive, businesses grow, and quality of life becomes a competitive advantage.***

The highest return on investment (ROI) a municipality or county can generate is not from a single deal, but by building a community strong enough to sustain thousands of them.

This white paper is written from lived practice, not theory—grounded in the belief that resilient economies are not imported, they are built from within.
